In the Claims:

Please cancel all the claims in this application and replace them with the following new

claims.

28. (New) A method of treatment of a patient suffering from or susceptible to a condition in which

an increase in the amount of tyrosine hydroxylase (TH) with the central nervous system (CNS) of said

patient is desirable, which method comprises the step of effecting an increase in the amount of TH

within the CNS through increasing the effective amount of GPE within the CNS of said patient.

29. (New) A method of effecting an increase in the amount of tyrosine hydroxylase (TH) within

the CNS of a patient for therapy or prophylaxis of a neurological disorder or condition involving

dopaminergic neurons, said method comprising the step of increasing the effective amount of GPE

within the CNS of the patient.

30. (New) A method of treatment of a patient suffering from or susceptible to a condition in which

an increase of tyrosine hydroxylase (TH)-mediated dopamine production is desirable, which method

comprises the step of effecting an increase in the amount of TH produced through increasing the

effective amount of GPE within the CNS of said patient.

31. (New) The method of treatment as claimed in claim 28 wherein the concentration of GPE is

increased by administering to said patient an effective amount of GPE.

32. (New) The method of treatment as claimed in claim 28 wherein the concentration of GPE is

increased in the CNS by direct administration of GPE.

33. (New) The method as claimed in claim 28 which is prophylactic.

34. (New) The method as claimed in claim 28 which is therapeutic.

35. (New) A method of treatment or prophylaxis of Parkinson's disease in a patient, which method

comprises increasing tyrosine hydroxylase (TH)-mediated dopamine production by dopaminergic

neurons within the substantia nigra of the CNS by the step of increasing the effective amount of GPE

within the CNS of said patient.

36. (New) The method of claim 28, wherein said condition is Parkinson's disease.

37. (New) The method of claim 29, wherein said condition is Parkinson's disease.

38. (New) The method of claim 30, wherein said condition is Parkinson's disease.

39. (New) The method of claim 28, wherein said GPE is administered via one or more routes

selected from the group consisting of lateral cerebro-ventricular injection, focal injection,

subcutaneous injection, intraperitoneal injection, intramuscular injection, oral administration, rectal

administration, nasal administration and inhalation.

40. (New) The method of claim 28, wherein said GPE is administered parenterally

41. (New) A method of inhibiting a decrease in tyrosine hydroxylase-containing neurons within

the CNS of a mammal in response to neural injury or disease, comprising administering an effective

amount of GPE to said mammal.

42. (New) A method of inhibiting a decrease in tyrosine hydroxylase within the CNS of a mammal

in response to neural injury or disease, comprising administering an effective amount of GPE to said

mammal.

43. (New) The method of claim 41, wherein said neurons are in the substantia nigra of said

mamma's CNS.

- 44. (New) The method of claim 42, wherein said neurons are in the substantia nigra of said mammal's CNS.
- 45. (New) The method of claim 35, wherein said GPE is administered via one or more routes selected from the group consisting of lateral cerebro-ventricular injection, focal injection, subcutaneous injection, intraperitoneal injection, intramuscular injection, oral administration, rectal administration, nasal administration and inhalation.
- 46. (New) The method of claim 35, wherein said GPE is administered parenterally
